**Abstract:** The determination of arsenic(III) and arsenic(V), as inorganic arsenite and arsenate, was investigated by CE with capacitively coupled contactless conductivity detection (CE-C<sup>4</sup>D). It was found necessary to determine the two inorganic arsenic species separately employing two different electrolyte systems. Electrolyte solutions consisting of 50 mM CAPS/2 mM L-arginine (Arg) (pH 9.0) and of 45 mM acetic acid (pH 3.2) were used for arsenic(III) and arsenic(V) determinations, respectively. Detection limits of 0.29 and 0.15  $\mu$ M were achieved for As(III) and As(V), respectively by using large-volume injection to maximize the sensitivity. The analysis of contaminated well water samples from Vietnam is demonstrated. ?? 2007 Wiley-VCH Verlag GmbH & Co. KGaA, Weinheim.

**Author Keywords:** Capacitively coupled contactless conductivity detection; CE; Inorganic arsenic ions; Large-volume injection

**Index Keywords:** acetic acid; arginine; arsenic; arsenic acid; arsenic trioxide; electrolyte; article; capillary electrophoresis; chemical analysis; conductance; controlled study; Viet Nam; water analysis; water contamination; Arsenicals; Electric Conductivity; Electrolysis; Electrophoresis, Capillary; Electrophoresis, Microchip; Environmental Monitoring; Fresh Water; Inorganic Chemicals; Sensitivity and Specificity; Spectrophotometry, Atomic; Vietnam; Water Pollutants, Chemical
