Abstract: This work studies the structure and magnetic properties of $\text{Gd}_4(\text{Mn}_{0.05}\text{Sb}_{0.95})_3$ with the aim to clarify the role played by the magnetic Mn atom. Upon substitution of Mn for Sb in the parent Gd_4Sb_3 compound, it is found that the inverted Th_3P_4 -like structure has been somewhat expanded. The Curie temperature is increased while magnetic moment, measured in the field of 50kOe at 200K, is slightly reduced. The ferromagnetic semiconductor, $\text{Gd}_4(\text{Mn}_{0.05}\text{Sb}_{0.95})_3$, undergoes a ferromagnetic to paramagnetic transition at 270K. Observed anomalies occur in the magnetization vs. temperature curves measured in a very low magnetic field. They are attributed to magnetic inhomogeneities resulting from a structural modification in $\text{Gd}_4(\text{Mn}_{0.05}\text{Sb}_{0.95})_3$. ?? 2002 Elsevier Science B.V. All rights reserved.

Author Keywords: $\text{Gd}_4(\text{Mn}_{0.05}\text{Sb}_{0.95})_3$; In homogeneity; Magnetic phase transition; Structure

Index Keywords: Ferromagnetic materials; Magnetic field effects; Magnetic moments; Magnetic properties; Magnetization; Phase transitions; Structure (composition); Partial participation; Gadolinium compounds
